

Manufacturer: Utility Relay Company
10100 Queens Way
Chagrin Falls, Ohio 44023
United States of America

Product: Masterpact M Direct Replacement Trip Unit

Models: AMP-SAFE-PRO; AC-PRO-MP

Testing Commenced: Nov. 11, 2010

Testing Ended: May 20, 2013

Summary of Test Results: Page 4

Directive: EMC Directive (2004/108/EC)

Deviations (if applicable): N/A

Standards:

- ❖ **EN 60947-2:2006, inc. A1:2009 – Low-voltage switchgear and controlgear – Part 2: Circuit-breakers**
 - **EN 61000-4-2:2009** - Electromagnetic Compatibility-Part 4: Testing and measurement techniques – Section 2: Electrostatic discharge immunity test

GENERAL REPORT SUMMARY

This electromagnetic emission and immunity test report was generated by F2 Labs. The test report is based on testing performed by F2 Labs personnel according to the measurement procedures described in the test specifications given below and in the Test Procedures section of this report.

SECTION	TEST	RESULTS
9	Electrostatic Discharge	Pass
10	Radiated Immunity	Pass
11	Electrical Fast Transient Burst	Pass
12	Power Surge	Pass
13	Conducted Immunity	Pass
14	Radiated Emissions	Pass
15	Conducted Emissions	Pass

Note: Pass/Fail criteria are based upon the following condition: Where the results are compared to published test standard or manufacturer specified limits, the PASS or FAIL opinion is considered without applying the laboratory stated measurement uncertainty.

Reports noted as a revision replace all previously issued reports and/or antecedent report revisions issued under this job number.

1.0 ADMINISTRATIVE DATA

1.1 Management of Test Sample

The test sample was inventoried at the F2 Labs facility and returned to Utility Relay Company, according to the agreement between F2 Labs and the Client.

1.2 Abbreviations and Acronyms

The following abbreviations and acronyms may be used in this document.

- AM Amplitude Modulation
- BCI Bulk Current Injection
- CDN Coupling/Decoupling Network
- EFT Electrical Fast Transients
- EMC Electromagnetic Compatibility
- EMIC Electromagnetic Injection Clamp
- EN European Norm
- ESD Electrostatic Discharge
- EUT Equipment Under Test
- GRP Ground Reference Plane
- HCP Horizontal Coupling Plane
- HGP Horizontal Ground Plane
- IEC International Electrotechnical Commission
- KHz KiloHertz
- LISN Line Impedance Stabilization Network
- MHz MegaHertz
- OATS Open Area Test Site
- RF Radio Frequency
- VCP Vertical Coupling Plane

1.3 Document History

Document Number	Description	Issue Date	Approved By
F2LQ4234A-1A-01E	First Issue	May 28, 2013	K. Littell

2.0 PERFORMANCE CRITERIA

The following Performance Criteria is determined from Section J.2.1 of EN 60947-2:2006, inc. A1:2009.

SPECIFICATION	MINIMUM PERFORMANCE CRITERION
EN 61000-4-2	B
EN 61000-4-3	A
EN 61000-4-4	B
EN 61000-4-5	B
EN 61000-4-6	A

Performance Criterion A: During the test, the resistance against unwanted operation (step1) and functional characteristics (step 2) are verified. Any monitoring function shall correctly indicate the status.

Performance Criterion B: During the test, the resistance against unwanted operation is verified. Monitoring functions may include a false status. After the test the functional characteristics are verified.

3.0 MEASUREMENT OF UNCERTAINTY BUDGETS

The uncertainty in EMC measurements arises from several factors which affect the results, some associated with environmental conditions in the measurement room, the test equipment being used and the measurement techniques adopted.

The measurement uncertainty budgets detailed below are calculated from the test and calibration data.

MEASUREMENT	EXPANDED UNCERTAINTY
Conducted Emissions	3.75dB
Conducted Immunity	CDN 2.91dB BCI 3.77dB
Radiated Immunity	2.12dB
Radiated Emissions	6.93dB

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

4.0 LISTS OF EUT, ACCESSORIES AND TEST EQUIPMENT

4.1 Equipment Under Test (EUT):

4.3 Cables:

AMP-SAFE-PRO

Cable Function	Length	Shielded (Yes/No)
AC Mains	N/A	No
Current Input	<3m	No

AC-PRO-MP

Cable Function	Length	Shielded (Yes/No)
Current Transformer Phase A	<3.0 meters	No
Current Transformer Phase B	<3.0 meters	No
Current Transformer Phase C	<3.0 meters	No
Actuator	<3.0 meters	No
24V DC	<3.0 meters	No
R1	<3.0 meters	No
R2	<3.0 meters	No
ALR 1	<3.0 meters	No
ALR 2	<3.0 meters	No
FV Segregated	<3.0 meters	No
QT Input	<3.0 meters	No
QT Output	<3.0 meters	No

5.0 MODE OF OPERATION

The EUT was set up in a normal testing manner, powered by current running through it.

6.0 METHOD OF MONITORING

The EUT was monitored visually by watching the LED's on the front panel for any unexpected changes.

7.0 IMMUNITY DEGRADATION DEFINITION

The following shall constitute degradation:

- If the EUT changes states unexpectedly, locks up or trips unexpectedly.

8.0 REQUIRED MODIFICATIONS

No modifications were made to the EUT.

9.0 ELECTROSTATIC DISCHARGE TEST

9.1 Electrostatic Discharge Test Procedure

The ESD generator and discharge gun were used to conduct the tests outlined below. The waveform conforms to EN 61000-4-2. The generator was used to simulate electrostatic discharges to the EUT.

A horizontal coupling plane (HCP) conforming to the dimensions of EN 61000-4-2 was placed on a non-conductive table 0.8 meter above the ground reference plane (GRP). The HCP was connected to the GRP via two 470k ohm resistors. The EUT was placed on non-conductive material 0.5 mm above the HCP. The vertical coupling plane (VCP) was connected to the GRP through two 470k ohm resistors and positioned 10 cm from the appropriate face of the EUT, as required.

During the test, three different methods were used to determine if the equipment was susceptible to ESD: direct contact, air discharge and indirect discharge.

The direct contact method was used on all exposed conductive surfaces. Each point was contacted 10 consecutive times in the positive polarity and 10 consecutive times in the negative polarity with an electrostatic discharge from the ESD Gun.

The indirect discharge method was used on one point of the horizontal coupling plane (HCP) and to one point on the vertical coupling plane (VCP) located 10 cm from the edge of the EUT on all four sides of the EUT.

The air discharge method was used on all exposed non-conductive materials. These materials were scanned with the tip of the ESD gun. If the gun discharged at any point, 10 consecutive discharges in both positive and negative polarities were then made to that point.

Test Equipment Used:

Equipment Type	Asset Number	Manufacturer	Model	Serial Number	Calibration Due Date
Temp/Hum. Recorder	CL119	Extech	RH520	H005869	Nov. 16, 2011
ESD Immunity Tester	CL076	EMC-Partner	ESD3000	213	June 23, 2011

9.2 Electrostatic Discharge Test Data Sheet

Test Date:	Dec. 10, 2010	Test Engineer:	M. Toth
Standard:	EN 60947-2:2006, inc. A1:2009	Air Temperature:	17.7° C
Minimum Performance Criteria:	B	Relative Humidity:	57%

AC-PRO-MP

Conductive Surfaces:

Discharge Point	Levels (kV)	Method	Achieved Performance Criterion	Pass/Fail
Screws	$\pm 2, 4$	Contact	A	Pass
USB Connector	$\pm 2, 4$	Contact	A	Pass
Reset Button for Actuator	$\pm 2, 4$	Contact	A	Pass

Coupling Planes:

Discharge Point	Levels (kV)	Method	Achieved Performance Criterion	Pass/Fail
Vertical Coupling Plane – Right Side	$\pm 2, 4$	Contact	A	Pass
Vertical Coupling Plane – Left Side	$\pm 2, 4$	Contact	A	Pass
Vertical Coupling Plane – Front Side	$\pm 2, 4$	Contact	A	Pass
Vertical Coupling Plane – Rear	$\pm 2, 4$	Contact	A	Pass
Horizontal Coupling Plane – Right Side	$\pm 2, 4$	Contact	A	Pass
Horizontal Coupling Plane – Left Side	$\pm 2, 4$	Contact	A	Pass
Horizontal Coupling Plane – Front Side	$\pm 2, 4$	Contact	A	Pass
Horizontal Coupling Plane – Rear	$\pm 2, 4$	Contact	A	Pass

Non-Conductive Surfaces:

Attempted Discharge Point	Levels (kV)	Method	Achieved Performance Criterion	Pass/Fail
Buttons	$\pm 2, 4, 8$	Air	No Discharge	Pass
Display	$\pm 2, 4, 8$	Air	No Discharge	Pass

Please refer to the photographs on pages 14-17 for details of actual test points. “C” denotes a contact discharge point. “A” denotes a point where a discharge was observed during a scan of a non-conductive surface. Absence of any Air Discharge points indicates no arc was drawn through the insulated surfaces.

10.0 RADIATED IMMUNITY TEST

10.1 Radiated Immunity Test Procedure

The Equipment Under Test (EUT) was placed in a semi-anechoic chamber on a 0.8-meter high non-conductive table. A broadband antenna was placed 1.8 meters from the EUT and was used to radiate RF energy at the EUT in both horizontal and vertical polarities.

The RF energy consisted of a signal that was stepped at 1% increments through the frequency ranges of 80 MHz to 1000 MHz, and 1400 MHz to 2000 MHz, at a rate slower than the reaction time of the EUT. The signal was 80% AM modulated with a 1 kHz sine wave and had a minimum calibrated field strength of 10.0/10.0 volts/meter at the surface of the EUT, as specified in the following test data sheet. The EUT was exposed to the RF energy on four different surfaces (front, rear, left and right sides).

The test setup conformed to figure 2 of EN 61000-4-3.

10.0 ELECTRICAL FAST TRANSIENT/BURST TEST

10.1 Electrical Fast Transient/Burst Test Procedure

The Electrical Fast Transient Burst generator was used to conduct the tests outlined below. The waveform conforms to EN 61000-4-4. This generator was used to simulate RF energy coupled onto power and data cables from switches, relays, motors, and any other device that could produce a voltage “spike.”

During the testing, the product was placed above a ground plane on a 0.1-meter high non-conductive platform. The setup conformed to EN 61000-4-4, figure 7. The transient energy (as defined in EN 61000-4-4) was coupled to the cables under test at various levels and polarities as defined by the standard. (Refer to the test data sheet for the details of this test.)

During the test, all data cables that may have a practical length greater than 3.0 meters, and all power mains cables were tested as outlined below.

AC Mains

The transient energy was coupled through the EFT generator coupling/decoupling network to each conductor of the power mains cable with respect to ground.

11.0 SURGE IMMUNITY TEST

11.1 Surge Immunity Test Procedure

The test was performed on the unit as per EN 60947-2 and C37.90.1. The surge pulse duration from the combination wave generator was 1.2/50 μ s voltage into an open circuit as high as 2.5 kV and an 8/20 μ s current pulse into a short circuit. Each pulse was injected 5 times in each polarity with a minimum of 10 seconds interval between each pulse.

AC Mains

The AC Mains lines were coupled to the surge generator through a capacitor/resistor coupling network as described in paragraph 7, figure 10. Surges were applied to each AC line and protective earth in both line-to-line and line-to-earth modes.

12.0 CONDUCTED IMMUNITY TEST

12.1 Conducted Immunity Test Procedure

The Equipment Under Test (EUT) was placed 0.1 meter above a ground reference. A bulk current injection probe (BCI), EM Injection Clamp (EMIC) or Coupling/Decoupling Network (CDN) was connected to the EUT’s power cord and was used to couple RF energy onto all lines of the power to the EUT. A Bulk Current Injection Clamp (BCI) or EM Injection Clamp (EMIC) was used to couple RF energy onto all data, control and I/O lines if an appropriate coupling/decoupling network (CDN) was not available.

The RF energy consisted of a signal that was stepped at 1% increments through the frequency range of 0.15 MHz to 80 MHz at a rate slower than the reaction time of the EUT. The signal was 80% AM modulated with a 1 kHz sine wave and had a minimum calibrated level of 10.0 Volts rms.

The test setup conformed to figure 2 of EN 61000-4-6.

13.0 RADIATED EMISSIONS TEST

13.1 Radiated Emissions Test Procedure

The EUT was initially placed in a semi-anechoic chamber, and wide band characterization measurements were performed to determine the frequencies at which significant emissions occurred.

The equipment was installed on a 0.8-meter high non-conductive turntable on an Open Area Test Site (OATS) as described in EN 55011. A receiving antenna was located 10.0 meters from the edge of the Equipment under Test (EUT). The antenna was attached to an antenna mast that allowed the antenna height to be adjusted from 1.0 to 4.0 meters above the ground plane.

The equipment was then fully exercised with all cabling attached to the EUT. While the equipment was energized, the receiving antenna was scanned from 1.0 meter to 4.0 meters in both vertical and horizontal polarities while the turntable was adjusted 360 degrees to determine the maximum field strength. During the test, frequencies identified as being generated by the EUT in the frequency range of 30 MHz to 1000 MHz were measured. The highest levels were recorded along with antenna polarity. These levels were then compared to the Class A limits specified in EN 55011.

14.0 CONDUCTED EMISSIONS TEST

14.1 Conducted Emissions Test Procedure

The equipment was installed on a 0.8-meter high non-conductive table as described in EN 55011. Power was provided to the Equipment under Test (EUT) through a Line Impedance Stabilization Network (LISN). An EMI receiver was also connected to the LISN to measure the RF emissions on the power lines of the EUT. The EUT was fully exercised with all cabling attached. The setup conforms to EN 55011. During the test, each conductor of the power mains was tested and emissions were measured over the frequency range of 0.15 MHz to 30 MHz. The highest levels were recorded and plots were taken showing the emissions on each conductor. These levels were compared to the Class A limits specified in EN 55011.
